SENDIT - Logistics and Delivery (Website&Application)

ISEHUNWA MICHAEL

Google

Project overview

The product:

SENDIT is a logistics and delivery platform designed to help Nigerian small-business owners manage deliveries with greater visibility, reliability and control. It brings delivery management, tracking and communication into one experience.

SENDIT
Logistics Company
Move Track Deliver

Project duration:

May 2025 To June 2025

Google

Project overview

The problem:

Small-business owners often manage orders manually while dealing with unreliable delivery, limited rider communication and poor shipment visibility. These gaps create customer anxiety, complaints and operational overhead.

The goal:

Design a simple, trustworthy delivery experience that gives businesses clearer control over orders and gives customers better visibility throughout the delivery journey.

Google

Project overview

My role:

Sole Product Designer.

Responsibilities:

User research

Personas & journey mapping

Information architecture

Paper & digital wireframes

Prototyping

Usability evaluation

High-fidelity UI design

Understanding the user

- User research
- Personas
- Problem statements
- User journey maps

User research: summary

To understand the needs of small business owners in nigeria, i conducted a mix of qualitative user research, including n-depth interviews and observational studies with 15 small business operators across Lagos, Abuja and Onitsha. My initial assumption was that most small businesses primarily struggled with high delivery cost. However, through my research i discovered that while cost is a concern, reliability, real-time tracking and communication with delivery personnels were far more pressing issues. Aditionally, i assumed users would be fairly tech savvy but many expressed a preference for simple interfaces, voice features and local languauge support especially among markert traders. This insight reshaped my product focus towards intuitive, accessible solutions that priortize trust and transperancy.

Google

User research: pain points

1

Pain point

Unreliable Delivery Services: Users frequently experience late or missed deliveries, leading to lost sales and customer complaints.
Design Implication: Prioritize features like real-time tracking, delivery confirmation, and a reliability score for riders or logistics partners.

2

Pain point

Lack of Communication During Delivery: Many users can't reach riders or don't receive updates, creating anxiety and mistrust.
Design Implication: Integrate in-app chat or call features, automated status updates, and customer notifications to ensure transparent communication.

3

Pain point

Complex or Cluttered Interfaces: Users, especially market traders, find existing logistics platforms confusing or difficult to navigate.
Design Implication: Use a clean, intuitive UI with large icons, minimal text, and optional voice-based navigation for ease of use.

4

Pain point

Manual Order Management: Online sellers are overwhelmed managing orders, delivery details, and customer info separately.
Design Implication: Build an all-in-one dashboard with order syncing from sales platforms (e.g., Instagram, WhatsApp), automated dispatch, and customer management tools.

Persona: Amina Suleiman

Age:	23
Education:	Graduate
Location:	Wuse II
Family:	Single
Occupation:	Online Fashion Retailer

""If i no make am until 25 na to marry one rich alhaji o"

if my customers cannot track their order or it arrives late, i lose trust and trust is everything in my business.

Goals

- Values customers service and delivery speedily
- Wants a centralized platform to handle both local and nationwide deliveries
- Prefers automated order syncing and real time tracking for her customers.

Frustrations

- Manages orders manually
- Lacks intergration between sales channels and delivery services
- Poor delivery feedback from customers.

Problem statement:

Amina is a digital - savvy and customer-focused person. she sees logistics as a key part of her brand reputation and wants semless, tech-enabled delivery solutins that match her fast paced business.

Google

Persona: Tolu Adebayo

‘Every minute wasted in traffic or confusion cost me money, ineed systems not guesswork.

Age:	41
Education:	Graduate,PGD.
Location:	Lagos
Family:	Married, No kids
Occupation:	Logistics Aggregator

“As you lay your bed so you lie on it, Na where man work, e go chop”

Goals

- Looking for a platform to manage rider assignments, route planning and customers communication
- Instrested in analytics for business scaling
- Wants to partner with small businesses via an intergrated delivery platform.

Frustrations

- Struggles with rider coordination and delivery tracking
- Needs help optimizing routes and managing multiple requests
- Wants better visibility into payments and performance metrics

Problem statement:

Tolu is efficiency driven, and sees logistics as a game of optimiztion. He is analytical and wants tools that would help him grow and streamline his operations with clear visibility and control.

Google

Persona: Chinedu Okeke

“i just want a delivery service that shows up when they say they would - no stories, no excuses.”

Age: 58
Education: Secondary
Location: school
Family: Onitsha
Occupation: Married, 4 kids
Market Trader

“It is risky, very risky to be poor so take that risk to become rich.”

Goals

- Wants affordable and reliable delivery to customers across southeastern Nigeria
- Prefers an app with voice note support.

Frustrations

- Struggles with unreliable nd expensive delivery options
- Difficulty tracking shipments
- Needs help coordinating deliveries from lagos to Onitsha.

Problem statement:

Chinedu is practical and values reliability over flashy features, he is tired of being let down by inconsistent logistics and wants tools that are simple, affordable and trustworthy.

Google

User journey map

[Amina's goal is to manage orders effortlessly and ensure timely, transparent deliveries.
Her thought process centers on efficiency and customer satisfaction at every step of the journey]

Persona: Amina

Goal: Wants her customers to be able to track their orders and arrives on time with good customer service for both local and nationwide deliveries .

ACTION	Recieve orders from Social media or business apps	Prepares order for delivery	Schedules and assigns delivery	Monitors delivery progress and updates customer	Confirms order completion and collects feedback	Review sales and delivery performance
TASK LIST	Tasks A. Check DMs B. Record customer info C. Confirm product availiability	Tasks A. Add order to system B. Enter address C.Select delivery option	Tasks A. Choose date/time B. Get pricing C.Assign to rider	Tasks A. View rider location B. Share tracking link C. Respond to customer	Tasks A.Confirms delivery B. Asks for customer feedback	Tasks A.Check reports B. Analyze delivery time and costs
FEELING ADJECTIVE	● Busy ● Alert ● Slightly stressed	● Focused ● Cautious	● Relieved ● Hopeful	● Anxious ● Responsible	● Satisfied ● Validated	● Reflective ● Motivated
IMPROVEMENT OPPORTUNITIES	● Auto-capture orders from social platfroms use pre-filled orders forms	● Enable drag and dro or auto-sync input, validate addresses in real-time.	● Provide recommende d options, enable batching for multiple deliveries	● Send automted stat updates. in-app chat with rider and customer	● Auto-prompt customers for feedback,adds delivery rating to order dashboard	● Provides visual analytics, suggest ways to improve efficiency and reduce costs

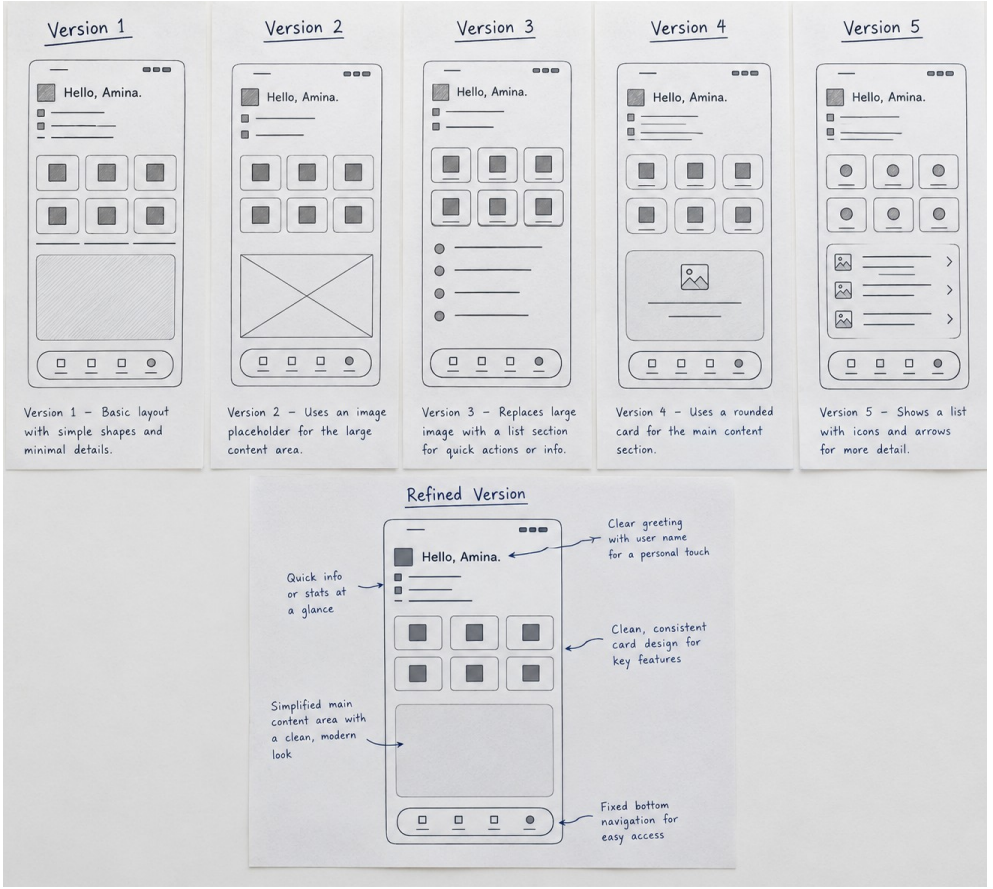

Google

Starting the design

- Paper wireframes
- Digital wireframes
- Low-fidelity prototype
- Usability studies

Paper wireframes

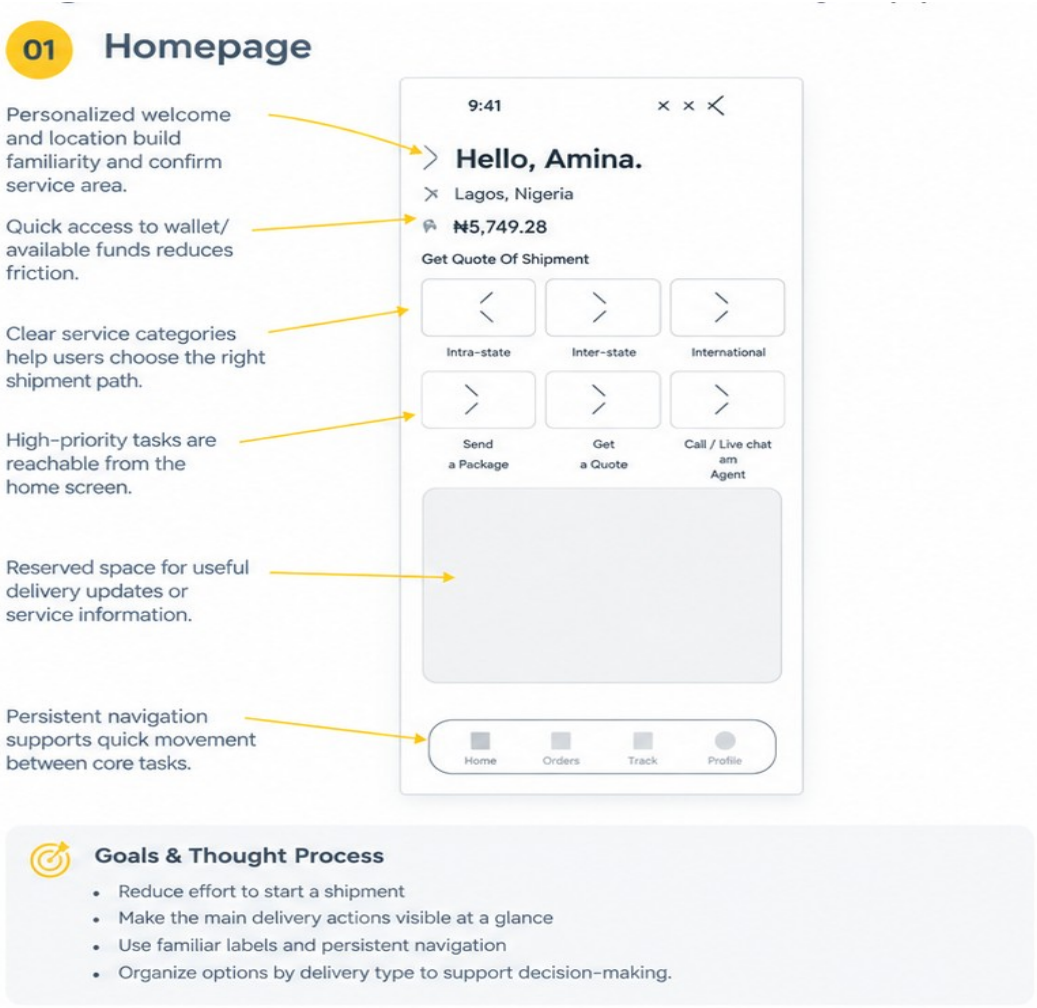

I explored multiple ways to structure the core delivery workflow before moving into digital screens. The focus was on keeping primary actions visible and reducing the number of steps needed to create or monitor a delivery

Google

Digital wireframes

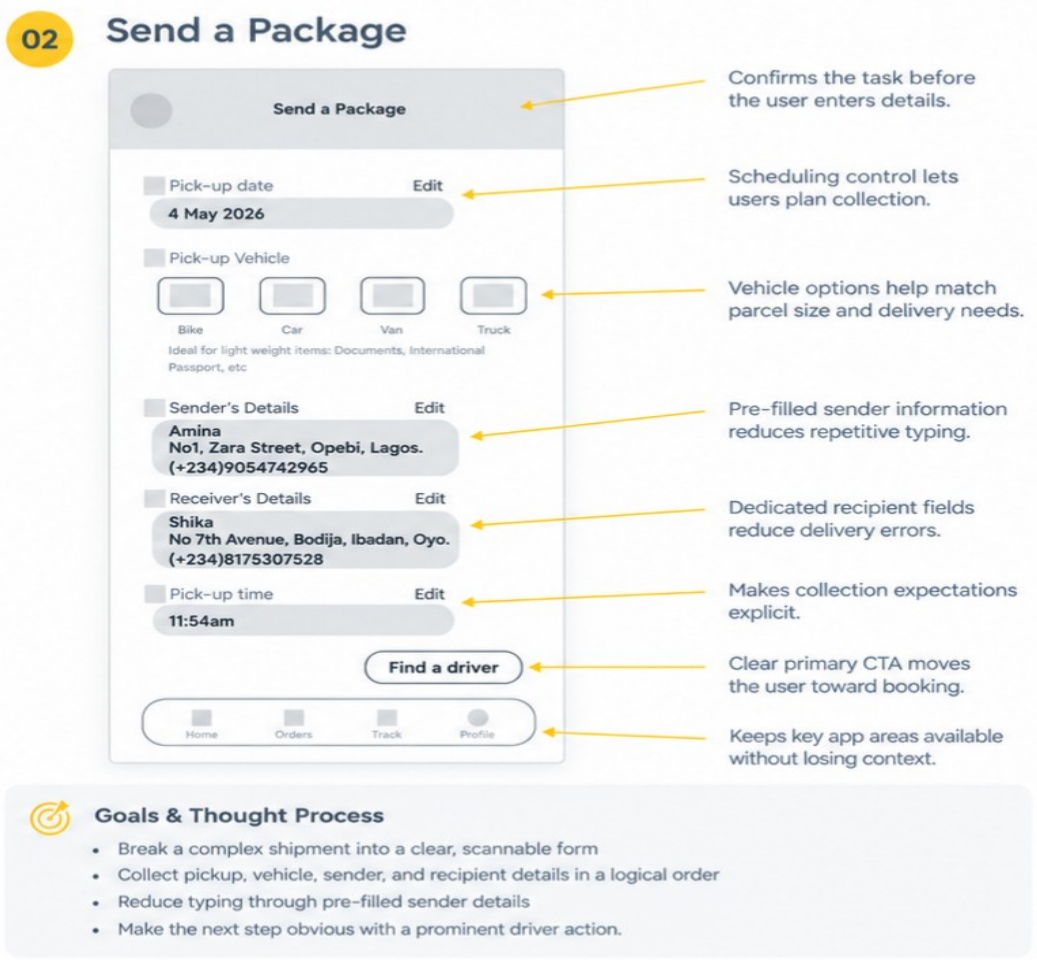

The digital wireframes translated the initial paper sketches into a structured mobile experience for Send IT, a logistics and delivery application designed to help small business owners manage their delivery needs more conveniently.

Digital wireframes

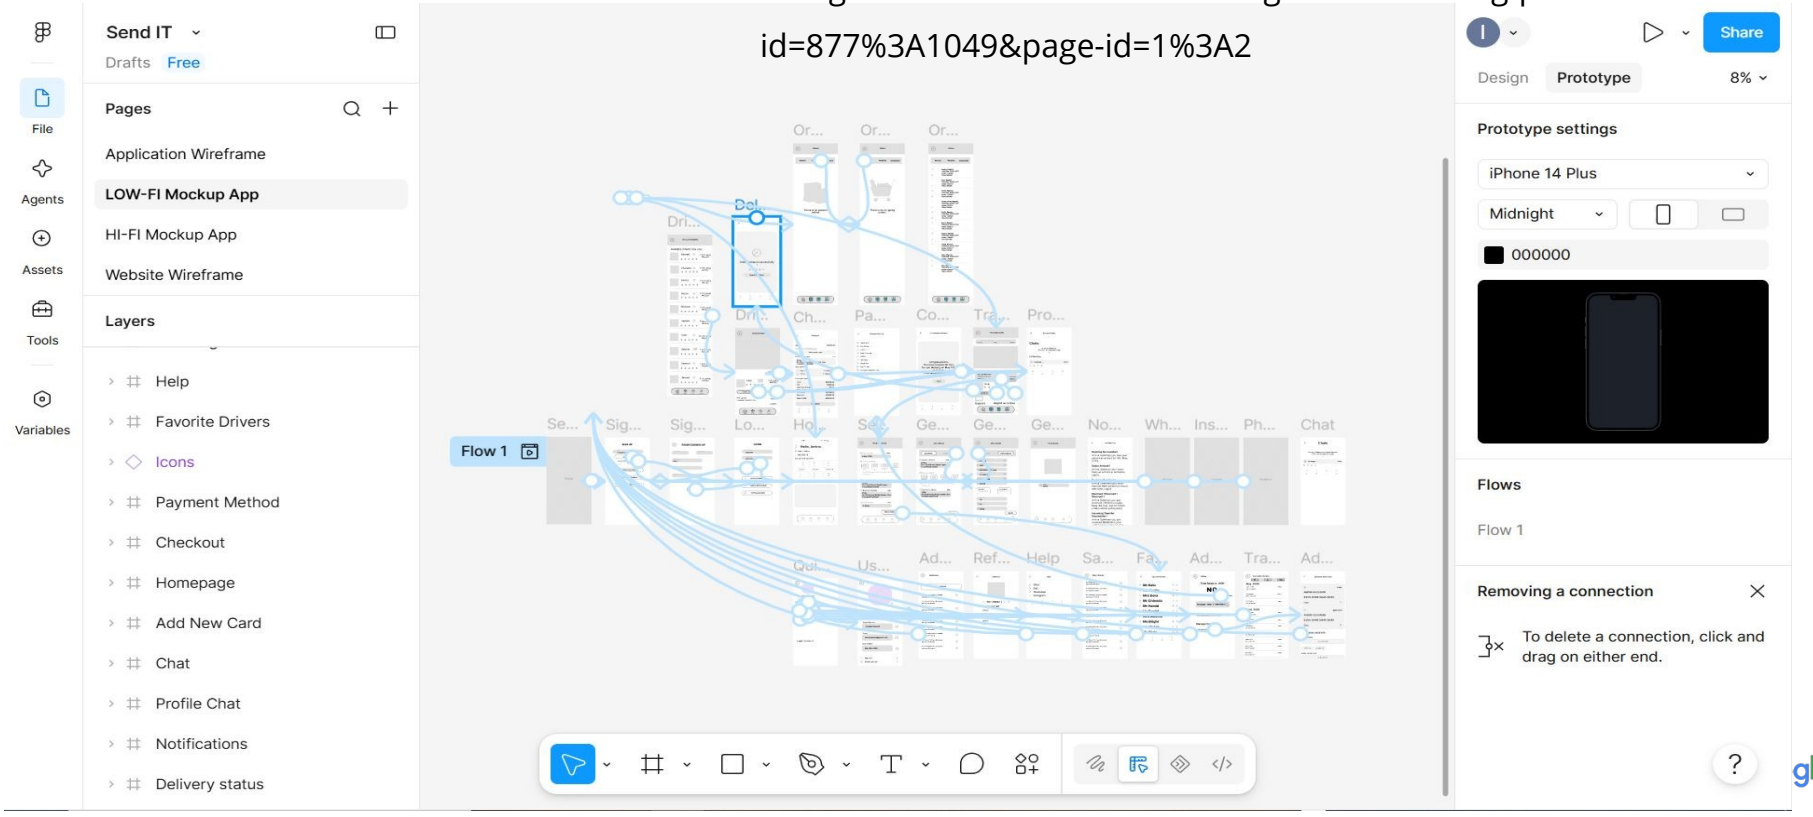

The primary goal was to design an intuitive dispatch screen that allows users to quickly select vehicle types, confirm delivery details, and find a nearby driver with minimal effort.

During the wireframing process, I explored different layouts for the pickup schedule, vehicle category chips, address details, and primary booking button.

Low-fidelity prototype

https://www.figma.com/proto/8qcOpQC0FsLZY3pGMJjh9l/Send-IT?node-id=877-1054&p=f&viewport=616%2C-168%2C0.06&t=ymdWjLloafkxpVPH-1&scaling=scale-down&content-scaling=fixed&starting-point-node-id=877%3A1049&page-id=1%3A2

Usability study: findings

This usability evaluation reviews the Sendit prototype across critical user tasks, from initiating a shipment to live tracking. The primary goal was to pinpoint baseline UX issues prior to testing with users. Key findings focus on improving visual scanning, clarifying form fields and edit actions, and displaying upfront fares and arrival times before booking confirmation.

Round 1 findings

1. Home actions are visible, but multi-line labels can slow scanning.
2. The send form groups date, vehicle, sender, recipient and time; small text and edit links may be easy to miss.
3. Driver prices and arrival times appear on the next screen, so users may not know the cost before tapping “Find a driver”.

Round 2 findings

1. Keep service choices distinct and use short, consistent labels with comfortable tap targets.
2. Strengthen field hierarchy and make “Edit” actions more noticeable; check address and phone details before continuing.
3. Show driver fare and ETA together, then make booking confirmation and tracking the clear next step.

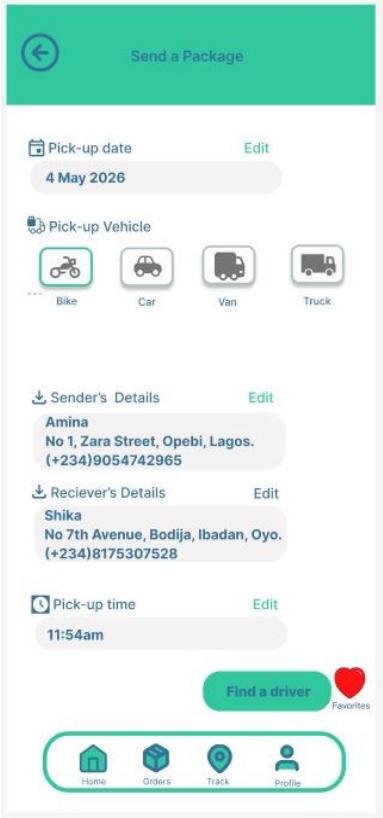

Refining the design

- Mockups
- High-fidelity prototype
- Accessibility

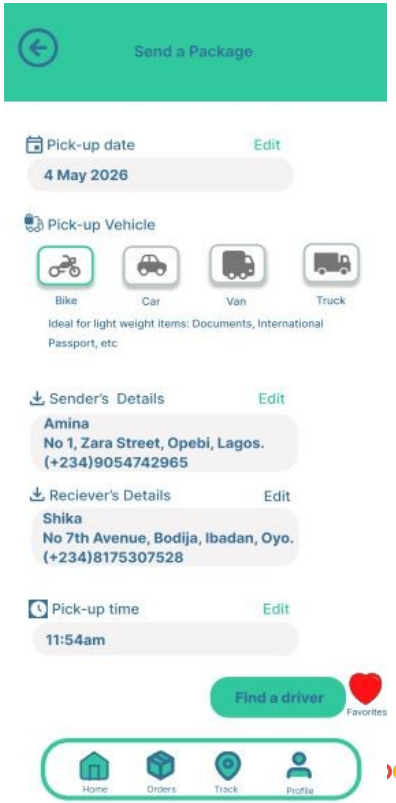

Mockups

During testing, 4 out of 5 users failed to select an appropriate vehicle type because they were unsure which vehicle fit their specific item size.

Before usability study

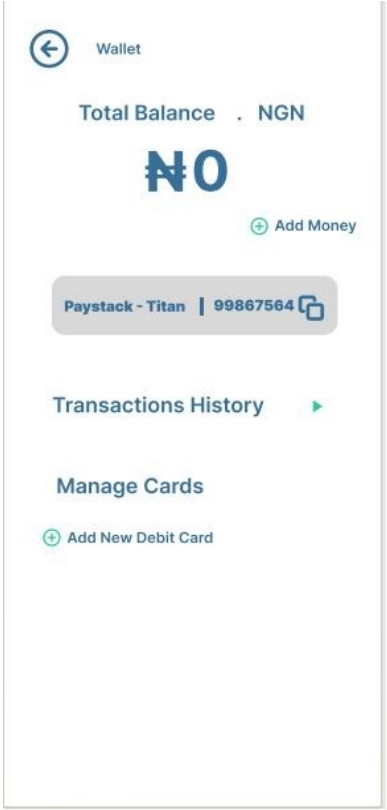

After usability study

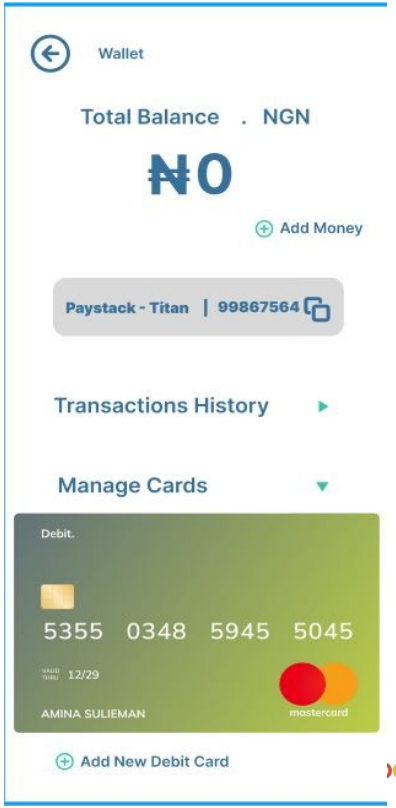

Mockups

During testing of the payment and checkout steps, users found it tedious to manually type out long debit card numbers and details every time they wanted to pay for an order.

Before usability study

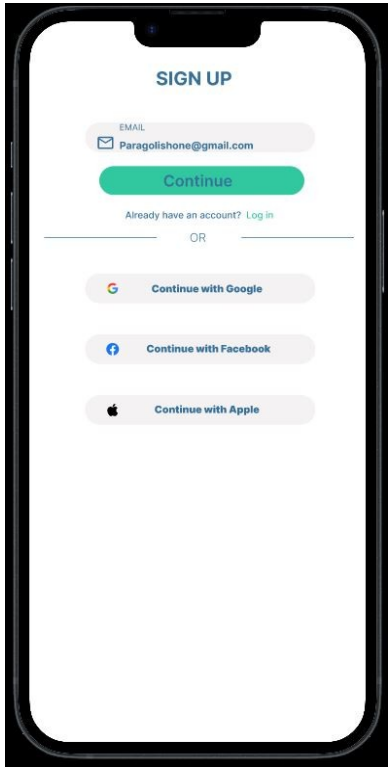

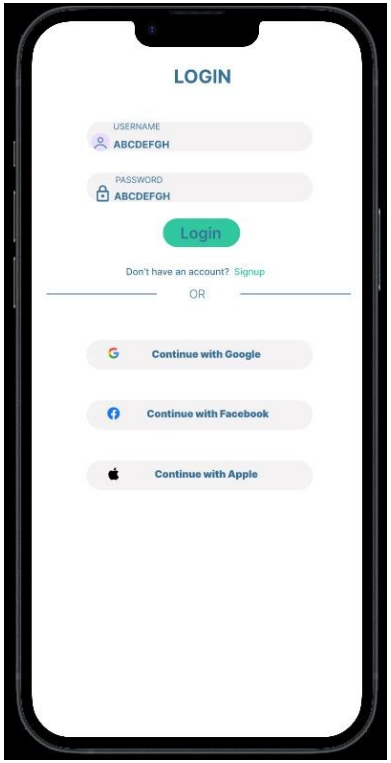

After usability study

High-fidelity prototype

https://www.figma.com/proto/8qcOpQC0FsLZY3pGMJjh9l/Send-IT?node-id=304-864&p=f&viewport=302%2C347%2C0.11&t=WMvLF9UpYJuKF9FO-1&scaling=scale-down&content-scaling=fixed&starting-point-node-id=304%3A864&page-id=67%3A3

Accessibility considerations

1

Detailed content summaries were generated to ensure screen readers provide meaningful context, enabling users with visual impairments to understand complex information and charts without difficulty. These descriptions are concise and informative.

2

Interactive elements were restructured to feature large, distinct touch targets and simplified button designs, significantly improving the navigation experience for users with motor control challenges or fine-motor skill limitations, reducing mis-taps

3

All complex form processes and error states were redesigned to include clear, specific instructions and multi-modal error feedback (text + icon), assisting users with cognitive disabilities or neurodiversity in navigating and completing tasks effectively.

Going forward

- Takeaways
- Next steps

Takeaways

Impact:

SENDIT translates research about reliability, communication and visibility into a more centralized delivery experience for small-business users. The case study demonstrates how research insights can directly shape product decisions

What I learned:

The project reinforced the value of challenging initial assumptions with research. Delivery cost mattered, but reliability, transparency and communication revealed deeper trust problems. Designing around those needs led to a clearer product direction.

Next steps

1

Pilot beta testing with local logistics partners

Deploy a closed beta version with a select group of independent riders and local courier businesses in Lagos to stress-test real-world delivery assignment speeds, live map tracking accuracy, and payment gateway settlement times under actual network conditions.

2

Integrate data-driven analytics and conversion tracking

Implement product intelligence tools (like Mixpanel or Hotjar) to monitor core user drop-off points—specifically tracking the conversion rate from initial shipment quote calculation down to completed payment and driver dispatch.

3

Design partner and driver-facing companion apps

Expand the product ecosystem by designing dedicated interfaces for delivery drivers and regional dispatch administrators, ensuring seamless order acceptance, live route optimization, and operational management.
